## Sketching Graphs of Quadratic Functions

## What you need to find out about the function $f(x)$

1. $f(0)$ gives the intercept of the graph with the $y$ axis
2. the roots of the $f(x)=0$ give the intercept of the graph with the $x$ axis
3. The coordinates of the turning point

## Finding the coordinates of the turning point

1. Using the equation of the graph; $y=a x^{2}+b x+c$
$x$ coordinate
Use the main features of a quadratic that;
2. the vertical line of symmetry passes through the turning point
3. the vertical line of symmetry also passes through the mid point of the

$$
\text { roots of } \boldsymbol{a} \boldsymbol{x}^{2}+\boldsymbol{b} \boldsymbol{x}=\mathbf{0}
$$

## $y$ coordinate

The $y$ coordinate is the value of the function $f(x)=x^{2}+\boldsymbol{b} x+\boldsymbol{c}$ when $x$ is set to the mid point of the roots of;

$$
a x^{2}+b x=0
$$

Using the equation of the graph vertex form; $y-k=a(x-h)^{2}$
The coordinates of the turning point are ( $\boldsymbol{h}, \boldsymbol{k}$ )

1. Start with $\boldsymbol{y}=\boldsymbol{a} \boldsymbol{x}^{2}+\boldsymbol{b} \boldsymbol{x}+\boldsymbol{c}$
2. Write the RHS in the form of a perfect square $\boldsymbol{y}=\boldsymbol{a}(\boldsymbol{x}+\boldsymbol{h})^{\mathbf{2}}-\boldsymbol{k}$
3. Add $\boldsymbol{k}$ to both sides to get; $\boldsymbol{y}+\boldsymbol{k}=\boldsymbol{a}(\boldsymbol{x}+\boldsymbol{h})^{\mathbf{2}}$
4. Adjust signs of $\boldsymbol{h}$ and $\boldsymbol{k}$ to give; $\boldsymbol{y}-\boldsymbol{k}=\boldsymbol{a}(\boldsymbol{x}-\boldsymbol{h})^{2}$
